

# EC2x Wi-Fi Application Note

#### **LTE Module Series**

Rev. EC2x\_Wi-Fi\_Application\_Note\_V1.0

Date: 2017-12-20

Status: Released

Our aim is to provide customers with timely and comprehensive service. For any assistance, please contact our company headquarters:

#### **Quectel Wireless Solutions Co., Ltd.**

7<sup>th</sup> Floor, Hongye Building, No.1801 Hongmei Road, Xuhui District, Shanghai 200233, China

Tel: +86 21 5108 6236 Email: info@quectel.com

#### Or our local office. For more information, please visit:

## **1** 4G+Wi-Fi Solution

#### 1.1. Introduction

The rapid development of LTE and IoT (Internet of Thing) accelerates the integration of 4G and Wi-Fi technology, many companies turn to convert the operator's 4G signals to Wi-Fi signals so that the smartphone, tablet and laptop users can enjoy free Wi-Fi access to share local resources and communicate with several terminals via high-speed network.

Therefore, Quectel provides a 4G+Wi-Fi one-stop solution based on its own EC2x<sup>1)</sup> LTE wireless modules and FC20 Wi-Fi module. This solution is realized through converting 4G signals into Wi-Fi signals to create Wi-Fi hotspots.

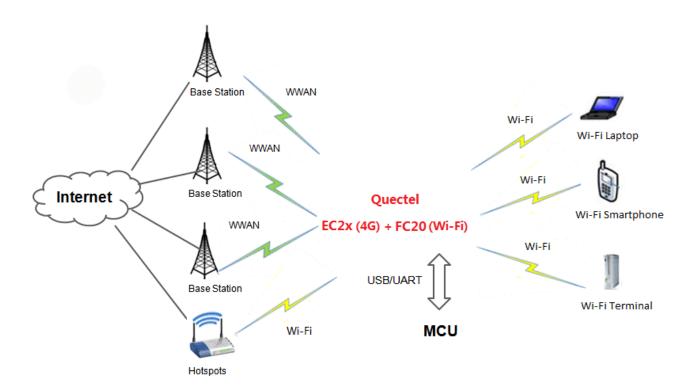

Figure 1: Software Workflow 4G+Wi-Fi One-stop Solution

- 1. Client and MCU can access to 4G network through EC2x modules at the same time.
- 2. MCU can control Wi-Fi connection by AT commands.
- 3. FC20 Wi-Fi module supports AP mode and STA\* mode, when there are other Wi-Fi hotspots around, network data can be uploaded to the Internet through other Wi-Fi hotspots to save data traffic.
- 4. EC2x LTE modules support various connections such as USB and UART.
- 5. The maximum access point is 16.

#### **NOTES**

- 1. 1) EC2x includes Quectel EC25, EC21, EC20 R2.0 and EC20 R2.1 modules.
- 2. "\*" means under development.

#### 1.2. FC20 Features

#### Table 1: FC20 Features

| Dimensions         | (16.6±0.15)mm × (13.0±0.15)mm × (2.1±0.2)mm  |
|--------------------|--|
| Package            | LCC  |
| Frequency          | WLAN-2.4GHZ: 2.412GHz ~ 2.484GHz<br>WLAN-5GHZ: 4.9GHZ ~ 5.925GHz<br>BT*: 2.402GHz ~ 2.48GHz      |
| The Number of Pins | 62   |
| Supply Voltage     | Main: 3.3V<br>IO: 1.8V   |
| WLAN Interface     | SDIO 3.0   |
| WLAN Standard      | 802.11a/b/g/n/ac   |
| Antenna            | Wi-Fi & BT antenna   |
| Transmission Data  | 433Mbps @802.11ac<br>150Mbps @802.11n<br>54Mbps @802.11a/g<br>11Mbps @802.11b<br>24Mbps @BT 4.1* |
| AP                 | Maximally 16   |

Operation Temperature -40°C ~ +85°C

"\*" means under development.

#### 1.3. Wi-Fi Solution Architecture

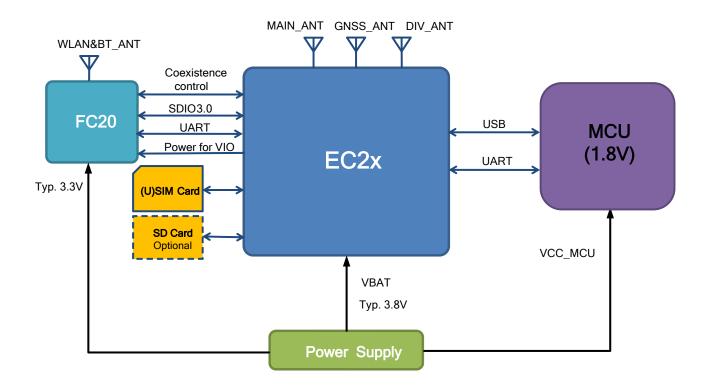

Figure 2: Wi-Fi Solution Architecture

- 1. EC2x modules communicate with FC20 through SDIO 3.0 interface, with maximum data rate up to 200Mb/s.
- 2. The communication between MCU and EC2x modules can be realized through USB or UART.
- 3. EC2x module can output GNSS information via USB NEMA port.
- 4. If the MCU voltage level is not 1.8V, then a voltage level translation circuit should be added between the module and the MCU.

# 2 Wi-Fi Related AT Commands

The following table lists the Wi-Fi related AT commands.

**Table 2: Wi-Fi Related AT Commands** 

| AT Commands  | Description   |
|--------------|---|
| AT+QWIFI     | Enable/Disable Wi-Fi Function                           |
| AT+QWSSIDHEX | Set SSID Encoding                                       |
| AT+QWSSID    | Set SSID  |
| AT+QWBCAST   | Enable/Disable Broadcast                                |
| AT+QWAUTH    | Set Authorization Type, Encryption Mode and Password    |
| AT+QWMOCH    | Frequency Mode and Channel Selection for 802.11 Network |
| AT+QWISO     | Enable/Disable Isolation                                |
| AT+QWCLICNT  | Query the Number of Wi-Fi Clients                       |
| AT+QWRSTD    | Restore Default Settings                                |
|              |   |

#### 2.1. AT+QWIFI Enable/Disable Wi-Fi Function

This command is used to enable or disable Wi-Fi function.

| AT+QWIFI Enable/Disable Wi-Fi Function |                         |
|--|-------------------------|
| Test Command                           | Response                |
| AT+QWIFI=?                             | +QWIFI: <value></value> |
|  |                         |
|  | ОК                      |
| Read Command                           | Response                |
| AT+QWIFI?                              | +QWIFI: <value></value> |
|  |                         |

|                           | ОК       |
|---------------------------|----------|
| Write Command             | Response |
| AT+QWIFI= <value></value> | OK       |
|                           | Or       |
|                           | ERROR    |

| <value></value> | The current state of Wi-Fi |
|-----------------|----------------------------|
|                 | 0 Wi-Fi is disabled        |
|                 | 1 Wi-Fi is enabled         |

#### **Example**

AT+QWIFI?

**+QWIFI: 0** //The Wi-Fi is currently disabled

OK

AT+QWIFI=1 //Enable Wi-Fi function

OK

### 2.2. AT+QWSSIDHEX Set SSID Encoding

This command is used to set the SSID (Service Set Identifier) encoding.

| AT+QWSSIDHEX Set SSID Enco      | ding                          |
|---------------------------------|-------------------------------|
| Test Command                    | Response                      |
| AT+QWSSIDHEX=?                  | +QWSSIDHEX: (0,1)             |
|                                 | ок                            |
| Read Command                    | Response                      |
| AT+QWSSIDHEX?                   | +QWSSIDHEX: <encode></encode> |
|                                 | OK                            |
| Write Command                   | Response                      |
| AT+QWSSIDHEX= <enable></enable> | OK                            |
|                                 | Or                            |
|                                 | ERROR                         |

| <encode></encode> | Set whether the <ssid> parameter of AT+QWSSID command is HEX number or not.</ssid> |  |
|-------------------|--|--|
|                   | <ssid> is saved separately.</ssid>   |  |
|                   | O Parameter of AT+QWSSID command is a string                                       |  |
|                   | 1 Parameter of AT+QWSSID command is HEX number                                     |  |
|                   |  |  |

#### **Example**

| •                                 |   |
|-----------------------------------|---|
| AT+QWSSIDHEX?                     |   |
| +QWSSIDHEX: 0                     | //The current SSID is the string                          |
| TOOIDITEA. 0                      | 77 The barrent Gold to the burns                          |
|                                   |   |
|                                   |   |
| AT+QWSSID?                        |   |
| +QWSSID: QSoftAP                  | //The current SSID is QSoftAP                             |
| 141100121 4001011                 | William Callette George                                   |
|                                   |   |
| OK                                |   |
| AT+QWSSIDHEX=1                    | //Set SSID to HEX number                                  |
| OK                                |   |
|                                   |   |
| AT+QWSSID?                        |   |
| +QWSSID: 5175656374656c2d57494649 | //The current SSID is Quectel-WIFI for the ASCII encoding |
|                                   |   |
| OK                                |   |
|                                   |   |

#### 2.3. AT+QWSSID Set SSID

This command is used to set Wi-Fi SSID.

| AT+QWSSID Set SSID       |                        |
|--------------------------|------------------------|
| Test Command             | Response               |
| AT+QWSSID=?              | +QWSSID: <ssid></ssid> |
|                          | ок                     |
| Read Command             | Response               |
| AT+QWSSID?               | +QWSSID: <ssid></ssid> |
|                          |                        |
|                          | OK                     |
| Write Command            | Response               |
| AT+QWSSID= <ssid></ssid> | OK                     |
|                          | Or                     |
|                          | ERROR                  |

<ssid> When AT+QWSSIDHEX=0:

ASCII string with length ≤ 32 bytes, and the default value is QSoftAP.

When the AT+QWSSIDHEX=1:

HEX digits. The length of raw data ≤ 32 bytes after coding (such as GBK, UTF-8, etc.). This

is mainly used to set SSID in Chinese.

#### **Example**

AT+QWSSIDHEX?

+QWSSIDHEX: 0

OK

AT+QWSSID?

**+QWSSID: QSoftAP** //The current SSID is QSoftAP

OK

AT+QWSSID=EC25\_WIFI //Set new SSID to EC25\_WIFI

OK

#### 2.4. AT+QWBCAST Enable/Disable Broadcast

This command is used to enable or disable the broadcast.

| AT+QWBCAST Enable/Disable B | Enable/Disable Broadcast  |  |
|-----------------------------|---------------------------|--|
| Test Command                | Response                  |  |
| AT+QWBCAST=?                | +QWBCAST: (0,1)           |  |
|                             | ок                        |  |
| Read Command                | Response                  |  |
| AT+QWBCAST?                 | +QWBCAST:<br><br><br><br> |  |
|                             |                           |  |
|                             | OK                        |  |
| Write Command               | Response                  |  |
| AT+QWBCAST=<br>broadcast>   | OK                        |  |
|                             | Or                        |  |
|                             | ERROR                     |  |

#### **Example**

AT+QWBCAST?

**+QWBCAST: 1** //The broadcast is enabled

OK

AT+QWBCAST=0 //Disable broadcast

OK

#### 2.5. AT+QWAUTH Set Authorization Type, Encryption Mode and

#### **Password**

This command is used to set network authorization type, encryption mode and password.

| AT+QWAUTH Set Authorization  | Гуре, Encryption Mode and Password   |
|--|--|
| Test Command   | Response   |
| AT+QWAUTH=?  | +QWAUTH: <auth></auth>   |
|  |  |
|  | OK   |
| Read Command   | Response   |
| AT+QWAUTH?   | +QWAUTH:   |
|  | <pre><auth>,<encrypt>[,<passwordindex>][,<password1>][,<p< pre=""></p<></password1></passwordindex></encrypt></auth></pre> |
|  | assword2>, <password3>,<password4>]</password4></password3>  |
|  |  |
|  | OK   |
| Write Command  | Response   |
| AT+QWAUTH=   | OK   |
| <auth>,<encrypt>[,<passwordindex>]</passwordindex></encrypt></auth>                      | Or   |
| [, <password1>][,<password2>,<pass< td=""><td>ERROR</td></pass<></password2></password1> | ERROR  |
| word3>, <password4>]</password4>   |  |

| <auth></auth>   | Autl     | horization type |
|---|----------|-----------------|
|   | 0        | Open/shared     |
|   | 1        | Open            |
|   | 2        | Shared          |
|   | 3        | WPA             |
|   | <u>4</u> | WPA2            |
|   | 5        | WPA/WPA2        |
| <encrypt> Enc</encrypt>   |          | cryption mode   |
|   | 0        | No encryption   |
|   | 1        | WEP             |
|   | 2        | TKIP            |
|   | <u>3</u> | AES             |
|   | 4        | TKIP-AES        |
| <passwordin< th=""><th>dex&gt;</th><th>Password string</th></passwordin<> | dex>     | Password string |
| <password1></password1>   | •        | Password string |
| <password2></password2>   | >        | Password string |
| <password3></password3>   | •        | Password string |
| <password4></password4>   | >        | Password string |

#### NOTE

The default network authorization mode is WPA2, encryption mode is AES and password is 1234567890. The setting of these parameters should comply with the following criteria:

- 1. If <auth> is 0 or 1, <encrypt> must be 0 or 1.
- 2. If <auth> is 2, <encrypt> must be 1.
- 3. If  $\langle \text{auth} \rangle \geq 3$ ,  $\langle \text{encrypt} \rangle \text{ must } \geq 2$ .
- 4. If <encrypt>=0, <passwordindex>, <password1>, <password2>, <password3>, <password4> are all null.
- 5. If  $\langle \text{encrypt} \rangle = 1$ :
  - 1)  $1 \le < passwordindex > \le 4$ ;
  - 2) <passwordindex>=1, <password1> must be in password format, <password2>, <password3>, <password4> can be set to "";
  - 3) Password format: 5 or 13 ASCII characters, 10 or 26 HEX number and ASCII characters need to add "".
- 6. If <encrypt> ≥2:
  - 1) <passwordindex> cannot be set.
  - 2) <password2>, <password3>, <password4> cannot be set.
  - 3) <password1> needs 8-63 ASCII characters or 64 HEX number and ASCII characters need to add "".

#### **Example**

|                     | 15  | n                             | 5G HT40 mode            |                                      |  |
| <channel></channel> | > Channel selection                         |                               |                         |                                      |  |
|                     | <u>0</u>                                    |                               |                         | Automatic selection                  |  |
|                     | 1-13  |                               |                         | 2.4G channel                         |  |
|                     | 36/40/44/48/52/56/60/64/149/153/157/161/165 |                               | /64/149/153/157/161/165 | 5G channel (currently not supported) |  |

#### NOTE

<mode> and <channel> should meet the following requirements:

- 1. If <mode> is 1/6/7/9/10/11/14/15, <channel> must be set to 0 or 36/40/44/48/52/56/60/64/149/153/ 157/161/165.
- 2. If <mode> is 2/3/4/5/8/12/13, <channel> can be set to 0-13.
- 3. If <mode> is 1/6/7/9/10/11/14/15, the client device must support 5G mode.

#### **Example**

| AT+QWMOCH?<br>+QWMOCH: 4,0 | //Current frequency mode is 2.4G b/g/n, automatically select channel |
|----------------------------|--|
| OK<br>AT+QWMOCH=3,1<br>OK  | //Set frequency mode to 2.4G b/g, channel 1                          |

#### 2.7. AT+QWISO Enable/Disable Isolation

This command is used to enable or disable isolation.

| AT+QWISO Enable/Disable Isolation |                                 |
|-----------------------------------|---------------------------------|
| Test Command                      | Response                        |
| AT+QWISO=?                        | +QWISO: (0,1)                   |
|                                   | ок                              |
| Read Command                      | Response                        |
| AT+QWISO?                         | +QWISO: <isolation></isolation> |
|                                   |                                 |
|                                   | OK                              |
| Write Command                     | Response                        |
| AT+QWISO= <isolation></isolation> | OK                              |
|                                   | Or                              |
|                                   | ERROR                           |

#### **Parameter**

| <isolation></isolation> | Isolation status |          |
|-------------------------|------------------|----------|
|                         | 0                | Disabled |
|                         | <u>1</u>         | Enabled  |

#### **Example**

AT+QWISO?

**+QWISO: 0** //Currently isolation is disabled

OK

AT+QWISO=1 //Enable isolation

OK

#### 2.8. AT+QWCLICNT Query the Number of Wi-Fi Clients

This command is used to query the number of clients connected to AP.

| AT+QWCLICNT Query the Numb | Query the Number of Wi-Fi Clients |  |
|----------------------------|-----------------------------------|--|
| Read Command               | Response                          |  |
| AT+QWCLICNT?               | +QWCLICNT: <count></count>        |  |

OK

**Parameter** 

<count> Number of clients connected to AP

**Example** 

AT+QWCLICNT?

**+QWCLICNT: 2** //Currently 2 clients are connected to AP

OK

#### 2.9. AT+QWRSTD Restore Default Settings

This command is used to restore Wi-Fi to default settings.

| AT+QWRSTD     | Restore Default Settings |          |
|---------------|--------------------------|----------|
| Write Command |                          | Response |
| AT+QWRSTD     |                          | OK       |

#### **Example**

| AT+QWRSTD | //Restore Wi-Fi to default settings |
|-----------|-------------------------------------|
| OK        |                                     |

# 3 Wi-Fi Related URC

#### 3.1. +QWIFIND URC of Client Connection Status

After Wi-Fi is enabled (AT+QWIFI=1), if a client is connected or disconnected to AP, the URC will be reported to indicate the client's MAC address.

#### +QWIFIND URC of Client Connection Status

+QWIFIND: <connect>,<mac>

#### **Parameter**

| <connect></connect> | Client connection/disconnection status                                      |  |
|---------------------|---|--|
|                     | 0 Client is disconnected to AP  |  |
|                     | 1 Client is connected to AP   |  |
| <mac></mac>         | MAC address of the client. Format: HEX number, such as: "0A:0B:0C:0D:0E:0F" |  |

#### **Example**

| +QWIFIND: 1,"0A:0B:0C:0D:0E:0F" | //The client of which MAC address is "0A:0B:0C:0D:0E:0F" has been connected to AP |
|---------------------------------|---|
| +QWIFIND: 0,"0A:0B:0C:0D:0E:0F" | //The client of which MAC address is "0A:0B:0C:0D:0E:0F" has been disconnected    |
